Summary

DevOps Intern at **BytePe**, a fintech startup, working on **GCP with Kubernetes (GKE), Helm, Terraform and GitLab CI/CD**. Migrated a 10-service backend from VMs to GKE Autopilot with my lead, built dev and staging deploy pipelines, and self-hosted an LLM on a GKE GPU node. Preparing for AWS Cloud Practitioner (December 2026).

Experience

BytePe **Jun 2026 – Present**
DevOps Intern *Noida*

- Migrated a 10-service backend from VMs to **GKE Autopilot** with my lead.
- Built **GitLab CI/CD** pipelines that deploy backend and frontend services, with migration Jobs, immutable image tags and automatic rollback.
- Took the front-end web service live on a new staging environment in the shared GKE cluster, with namespace-scoped **RBAC** for the CI deployer and credentials kept in protected, masked GitLab variables and Kubernetes Secrets.
- Managed GCP infrastructure with **Terraform** across dev, stage and prod: GKE Gateway, Cloud Armor, Workload Identity and IAM.
- Cut non-production compute hours by ˜64% by scaling workloads to zero outside working hours.
- Tuned HPA autoscaling and health probes, and wrote **k6** load tests for the platform and its Cloud Armor rules.
- Setting up monitoring for the GKE platform with **Google Cloud Managed Service for Prometheus** and **Grafana** (in progress).
- Self-hosted **NVIDIA Nemotron on vLLM** on a GKE GPU node and built a **RAG** proof of concept (pgvector, text embeddings) behind an internal Open WebUI chat.

Projects

Centralized Container Logging Stack | *Docker Compose, Grafana, Loki, Grafana Alloy* **Sep 2026**

- Built a self-hosted log aggregation stack with **Docker Compose**, running Grafana, Loki and Grafana Alloy as separate services.
- Configured an **Alloy** pipeline (discovery.docker → discovery.relabel → loki.source.docker → loki.write) that finds running containers through the Docker socket and labels each log stream by container name.
- Searched and filtered logs from every container in one place with **LogQL** in Grafana, using the container label to narrow results.
- Used named volumes so logs and Grafana state survive container restarts and rebuilds.

Technical Skills

Cloud & Infrastructure: Google Cloud (GKE Autopilot, Artifact Registry, Cloud Armor, IAM, Workload Identity, Cloud SQL, Cloud Storage), Kubernetes (HPA, probes, GKE Gateway), Helm, Terraform, Docker, Nginx; AWS.
CI/CD & Tooling: GitLab CI, GitHub Actions, Git, Linux (Ubuntu), SSH, k6 (load testing).
Observability: Grafana, Loki, Grafana Alloy, LogQL.
AI Infrastructure: vLLM, GPU workloads on GKE, RAG (pgvector, text embeddings), Open WebUI.
AI Tools: Claude Code for AI-assisted Terraform, Kubernetes manifests, CI/CD pipelines and debugging.
Networking: TCP/IP, DNS, HTTP/HTTPS, TLS, CIDR, NAT, L4/L7 load balancing, VPC.
Programming & Data: Python, Bash, JavaScript, Java, C++; SQL, PostgreSQL, MySQL, MongoDB.
Testing: Playwright, Postman, REST API testing.

Education

ITS Engineering College **Nov 2022 – June 2026**
B.Tech, Computer Science and Engineering (Data Science) *CGPA: 7.98*

Sadhana Devi Vidyapith **Apr 2020 – Aug 2021**
Class XII, Senior Secondary (CBSE) *Percentage: 91*
